

Cervical Spine Fracture Detection

Team FineSpine : Himanshu, Aayush, Saurabh

Problem Definition

- There has been a rise in the incidence of spinal fractures in the elderly and in this population, fractures can be more difficult to detect on imaging due to superimposed degenerative disease and osteoporosis.
- Quickly detecting and determining the location of any vertebral fractures is essential to prevent neurologic deterioration and paralysis after trauma.

**Me in my 20s with my
63 year old back pain**

Proposed Solution

- Creating an application that assists radiologists with Cervical Spine Fracture detection.
- Improve fracture detection accuracy.
- Reduce reporting time.
- Reduce workload.

Project Scope

Proof Of Concept (POC)

- Work on the RSNA kaggle competition
- Perform EDA
- Experiment on some baseline models.
- Compare models on different metrics. (ROC/AUC/Inference)
- Segmentation and Explainable AI

Prototype

- Create a mockup of screens to see how the app could look like
- Deploy one model to Fast API to service model predictions as an API

Minimum Viable Product (MVP)

- Create an app to detect cervical spine fracture
- API Server for uploading CT scan and predicting and segmenting the fracture.

Data

- We are using the data provided by RSNA kaggle challenge
- It has 2019 CT scans(dicom and nii files ~300 GB)
- Label Counts:
 - fractured vertebrae: 1058
 - normal vertebrae: 961

DICOM and NIFTI files

.dcm - **DICOM** file: A DCM file is an image file saved in the Digital Imaging and Communications in Medicine (DICOM) image format. It stores a medical image, such as a CT scan or ultrasound, and may also include patient information to pair the image with the patient.

.nii - **NIFTI file format** - A **nibabel image** object is the association of three things: an N-D array containing the image data; a (4, 4) affine matrix mapping array coordinates to coordinates in some RAS+ world coordinate space (Coordinate systems and affines); image metadata in the form of a header.

Data

Input data (.dcm and .nii files) are slices of the vertebrae in axial plane.

ID: 1.2.826.0.1.3680043.6200

Data Preprocessing

Convert Spinal Cord images from axial plane to Sagittal plane

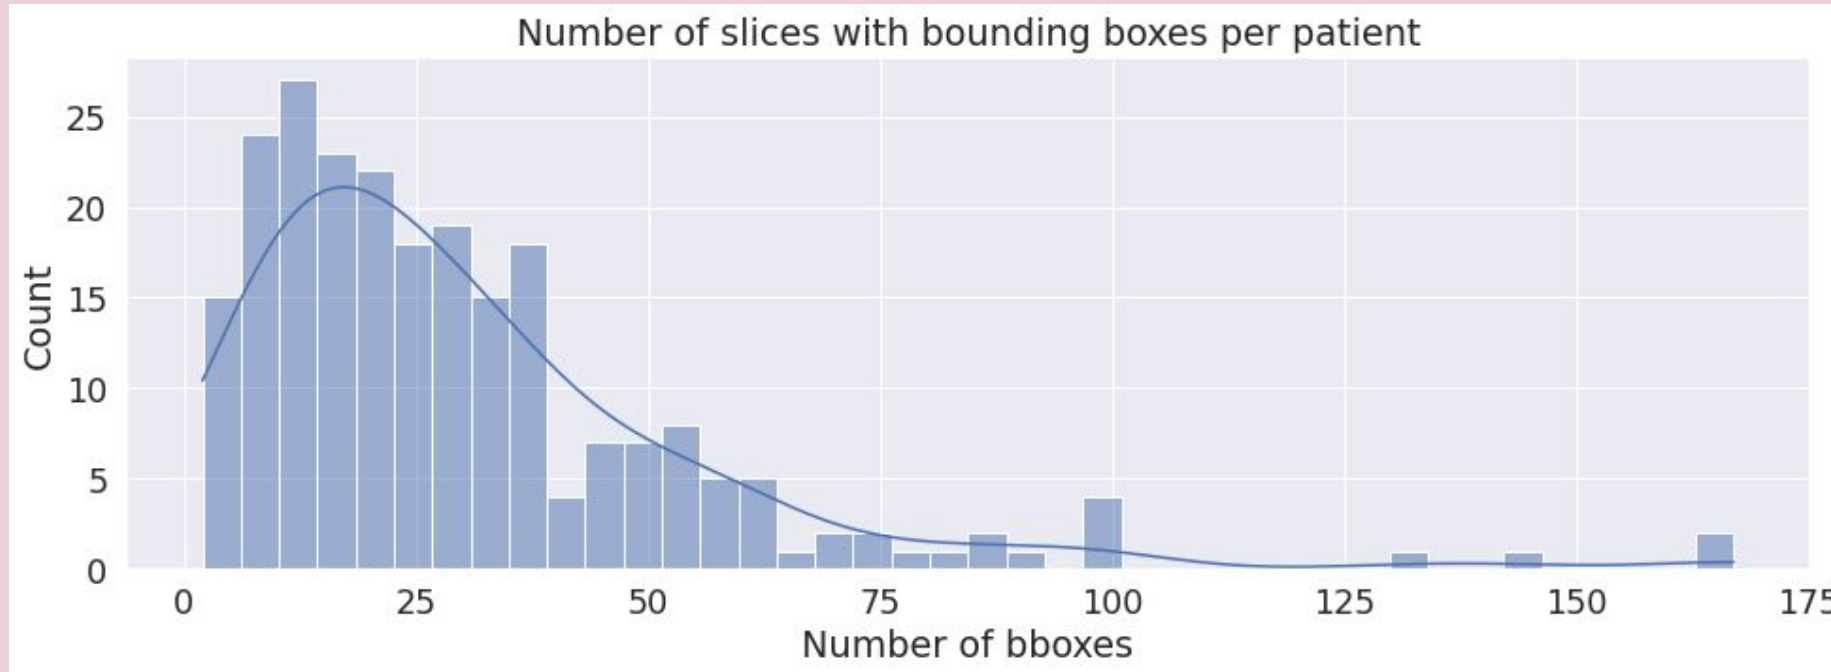

EDA

- The overall target is roughly balanced (52/48 split).
- C7 has the highest proportion of fractures (19%) whereas C3 has the lowest (4%).

EDA

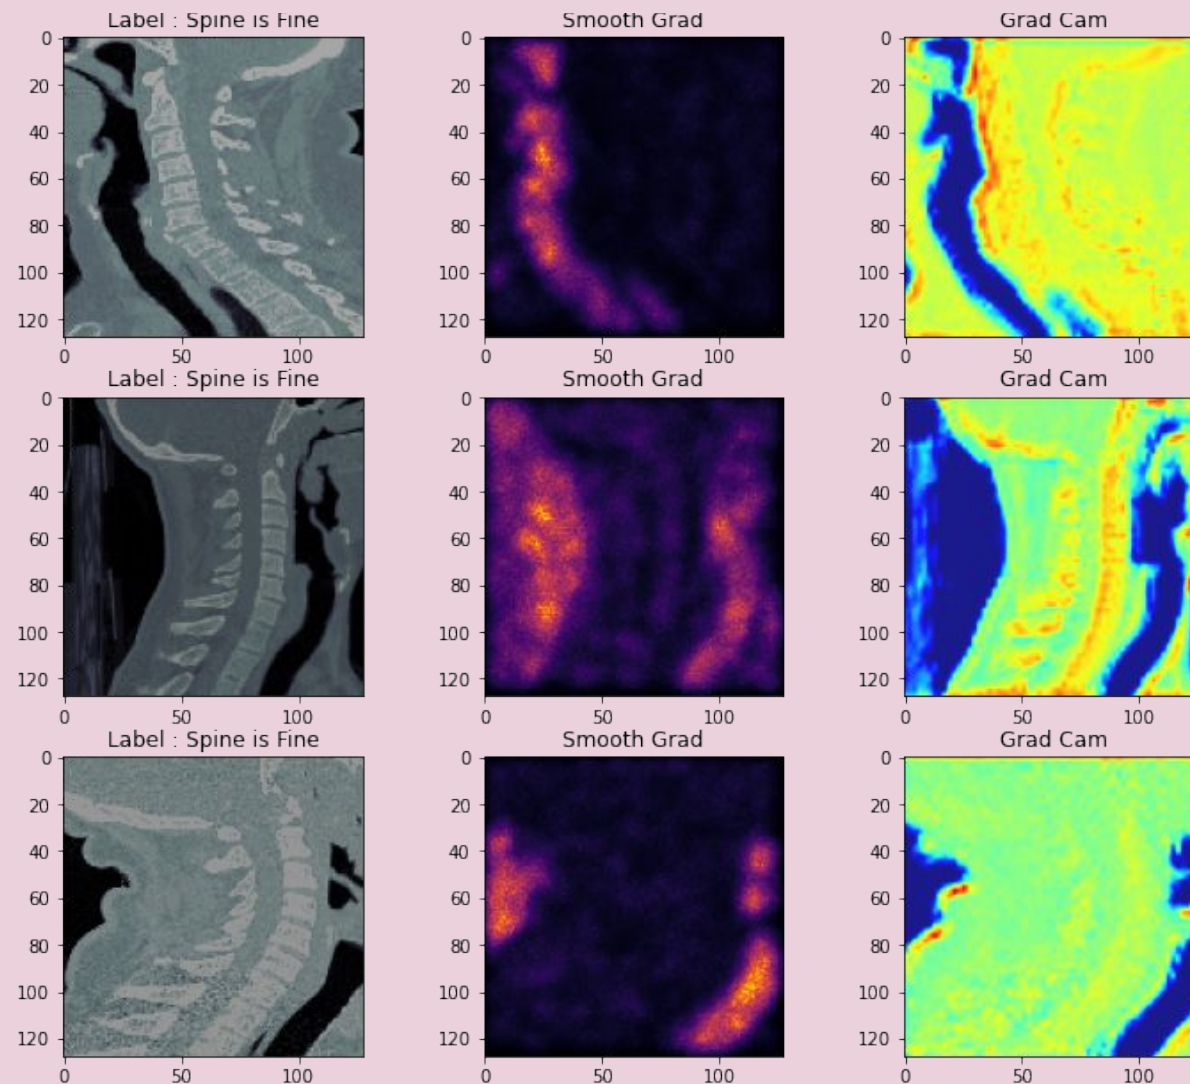

- We are only given bounding boxes for a subset of the data. In particular, only 12% of patients in the train set have any bounding box measurements.
- This information is useful in telling us exactly where the fractures have occurred.

Fracture Detection

Sr. No	Model	Validation Accuracy
1.	Exception	60%
2.	Resnet	55%
3.	EfficientNet	52.8%
4.	ConvNet model v1	61%
5.	ConvNet model v2	47.6%
6.	AlexNet	47.6%

GradCam & Smooth Grad

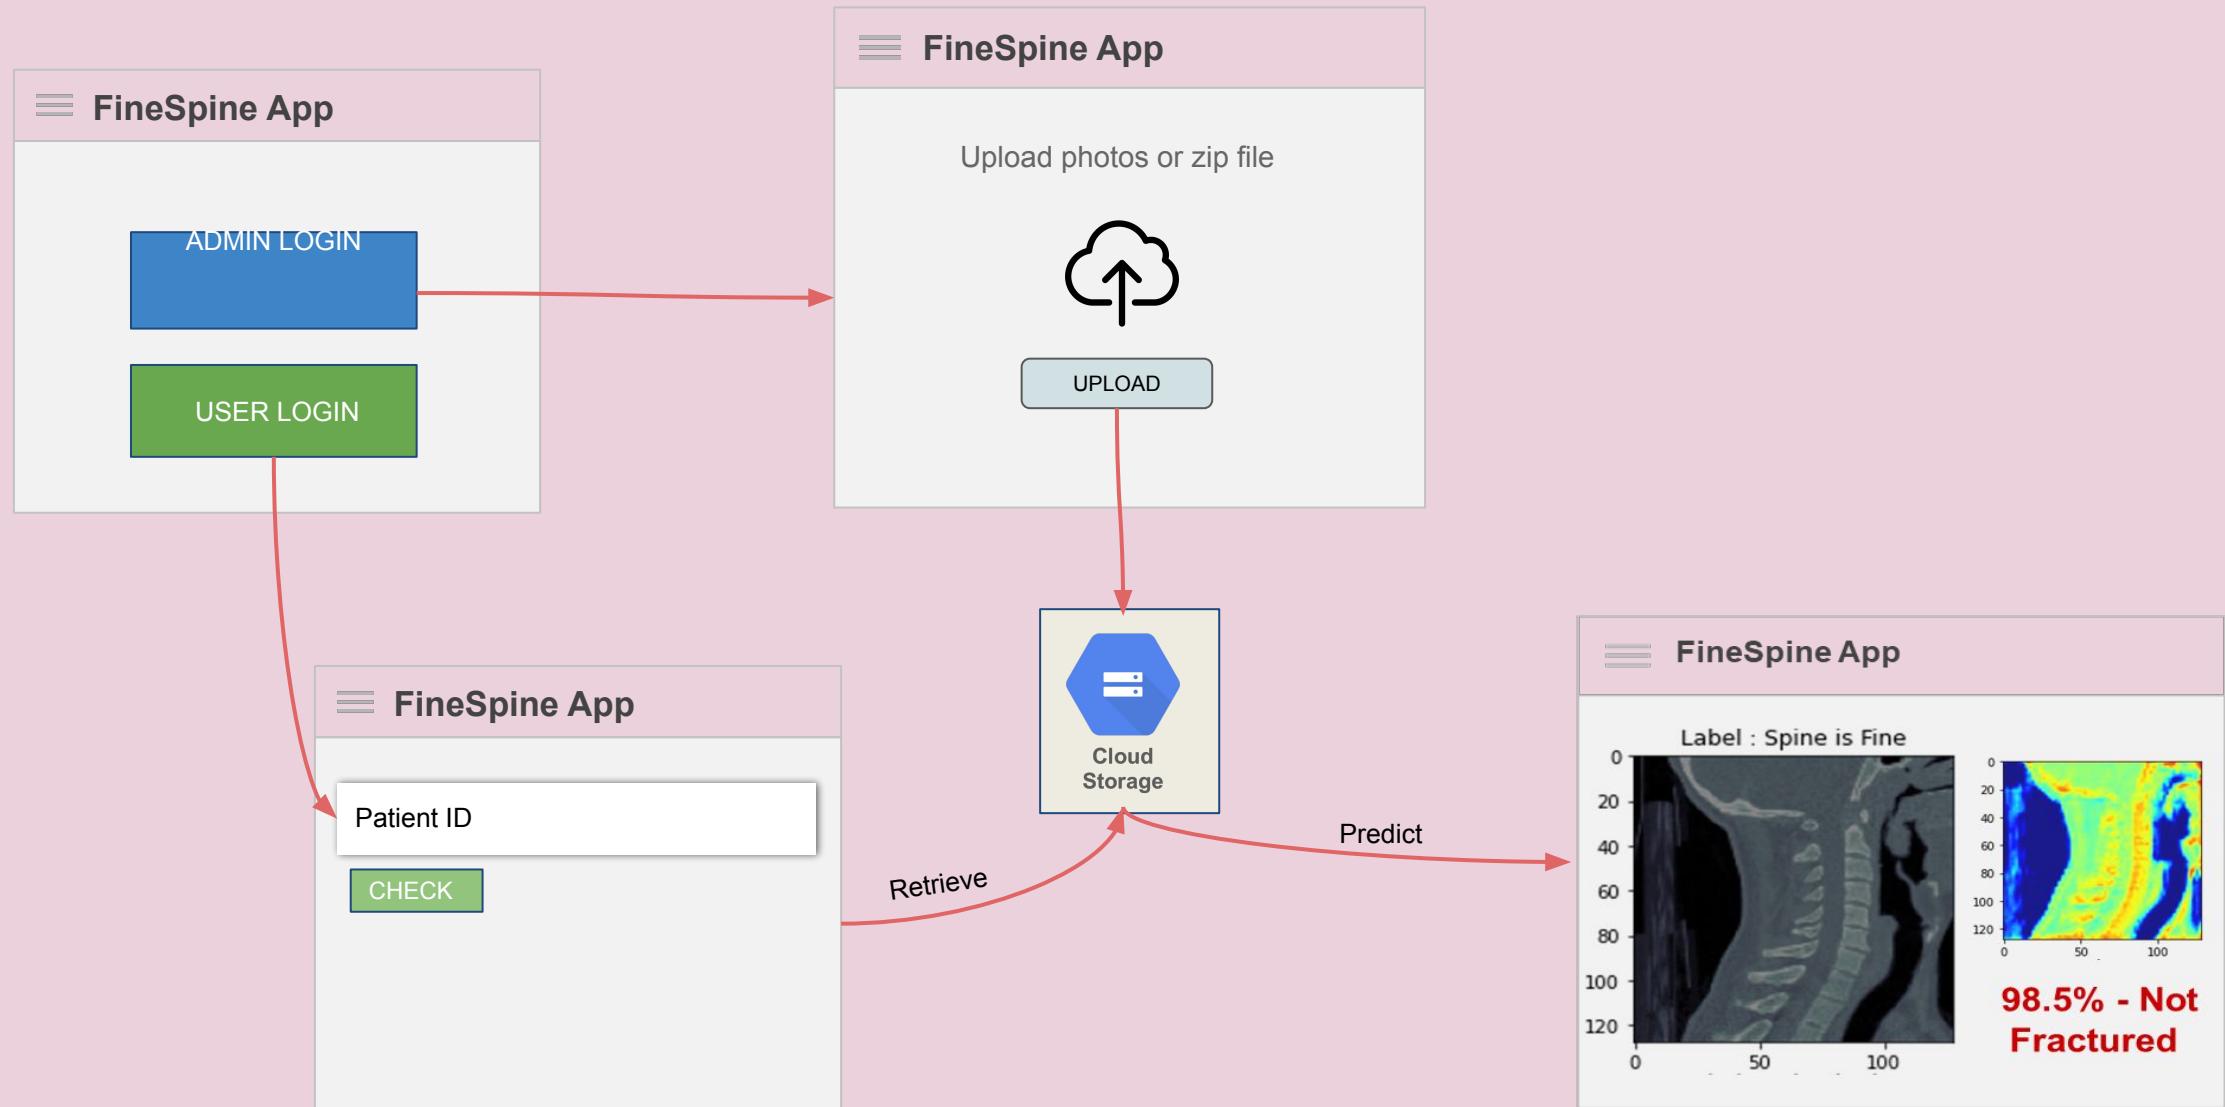

Fracture Identification

Sr. No	Model	Validation Accuracy
1.	Exception	6%
2.	Resnet	5.2%
3.	EfficientNet	7.6%
4.	ConvNet model v1	13.3%
5.	ConvNet model v2	12.9%
6.	AlexNet	20.5%

Screenflow & Wireframes

Solution Architecture

Process (People)

- Collect data from Kaggle
- Data Processing and EDA
- Model training/tuning
- Upload dicom files
- View prediction and explainability results
- Build App

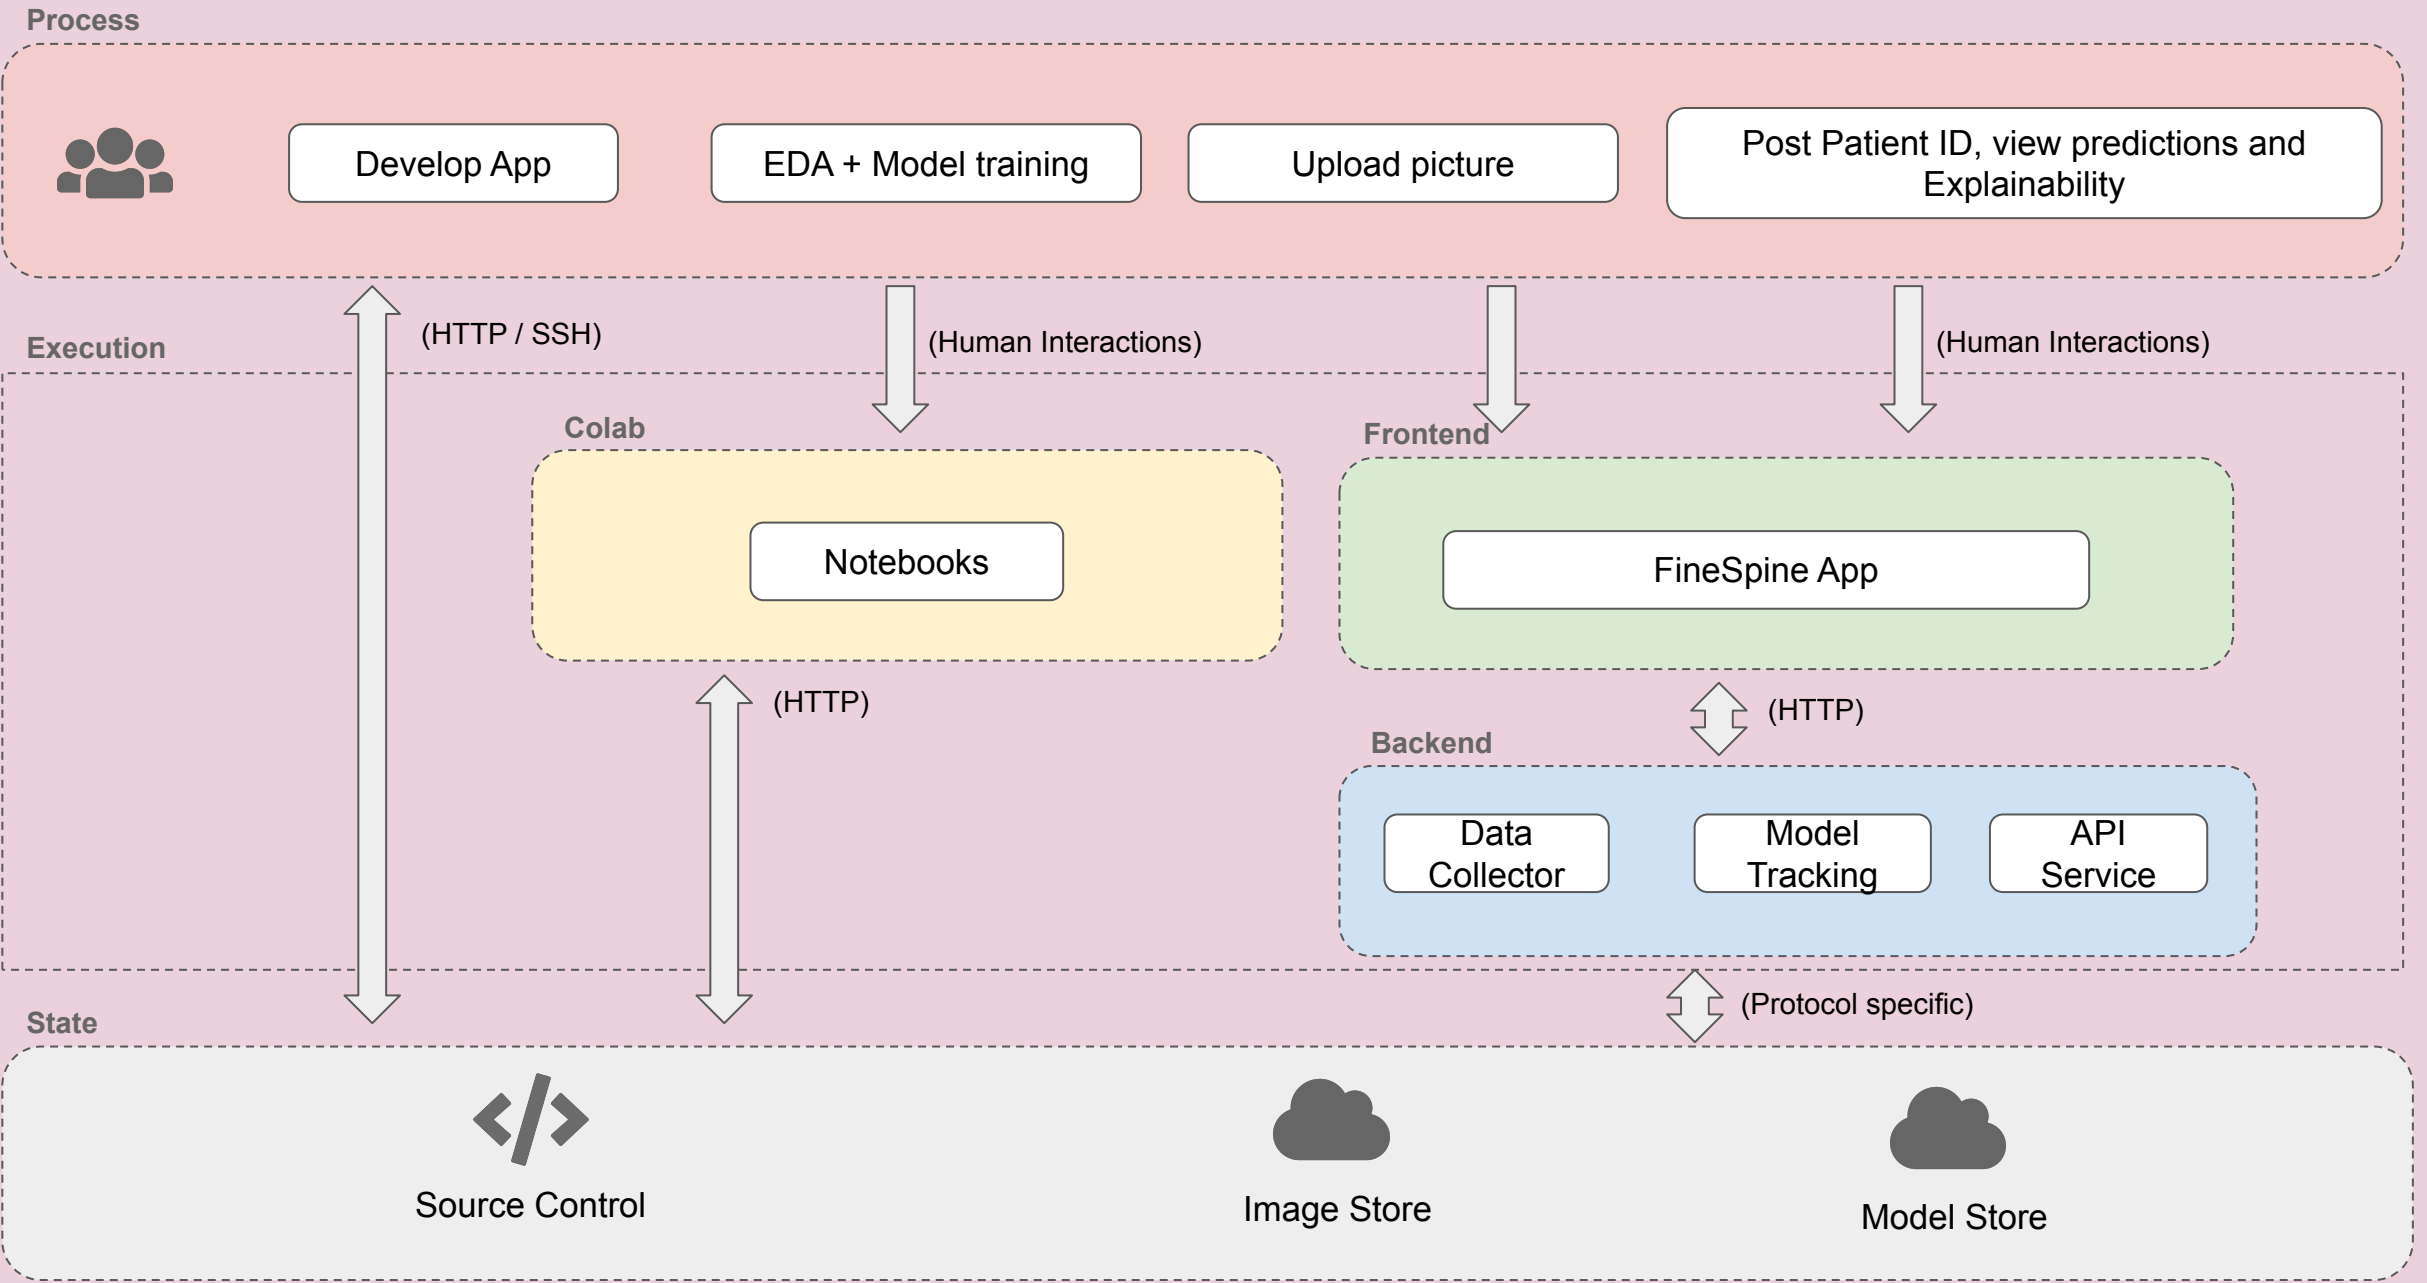

Execution (Code)

- Request customer id and extract customer dicom files from GCP
- Apply same preprocessing steps
- Use the best model to make prediction
- Return results to user
- Spine Fracture or not
- Show model explainability

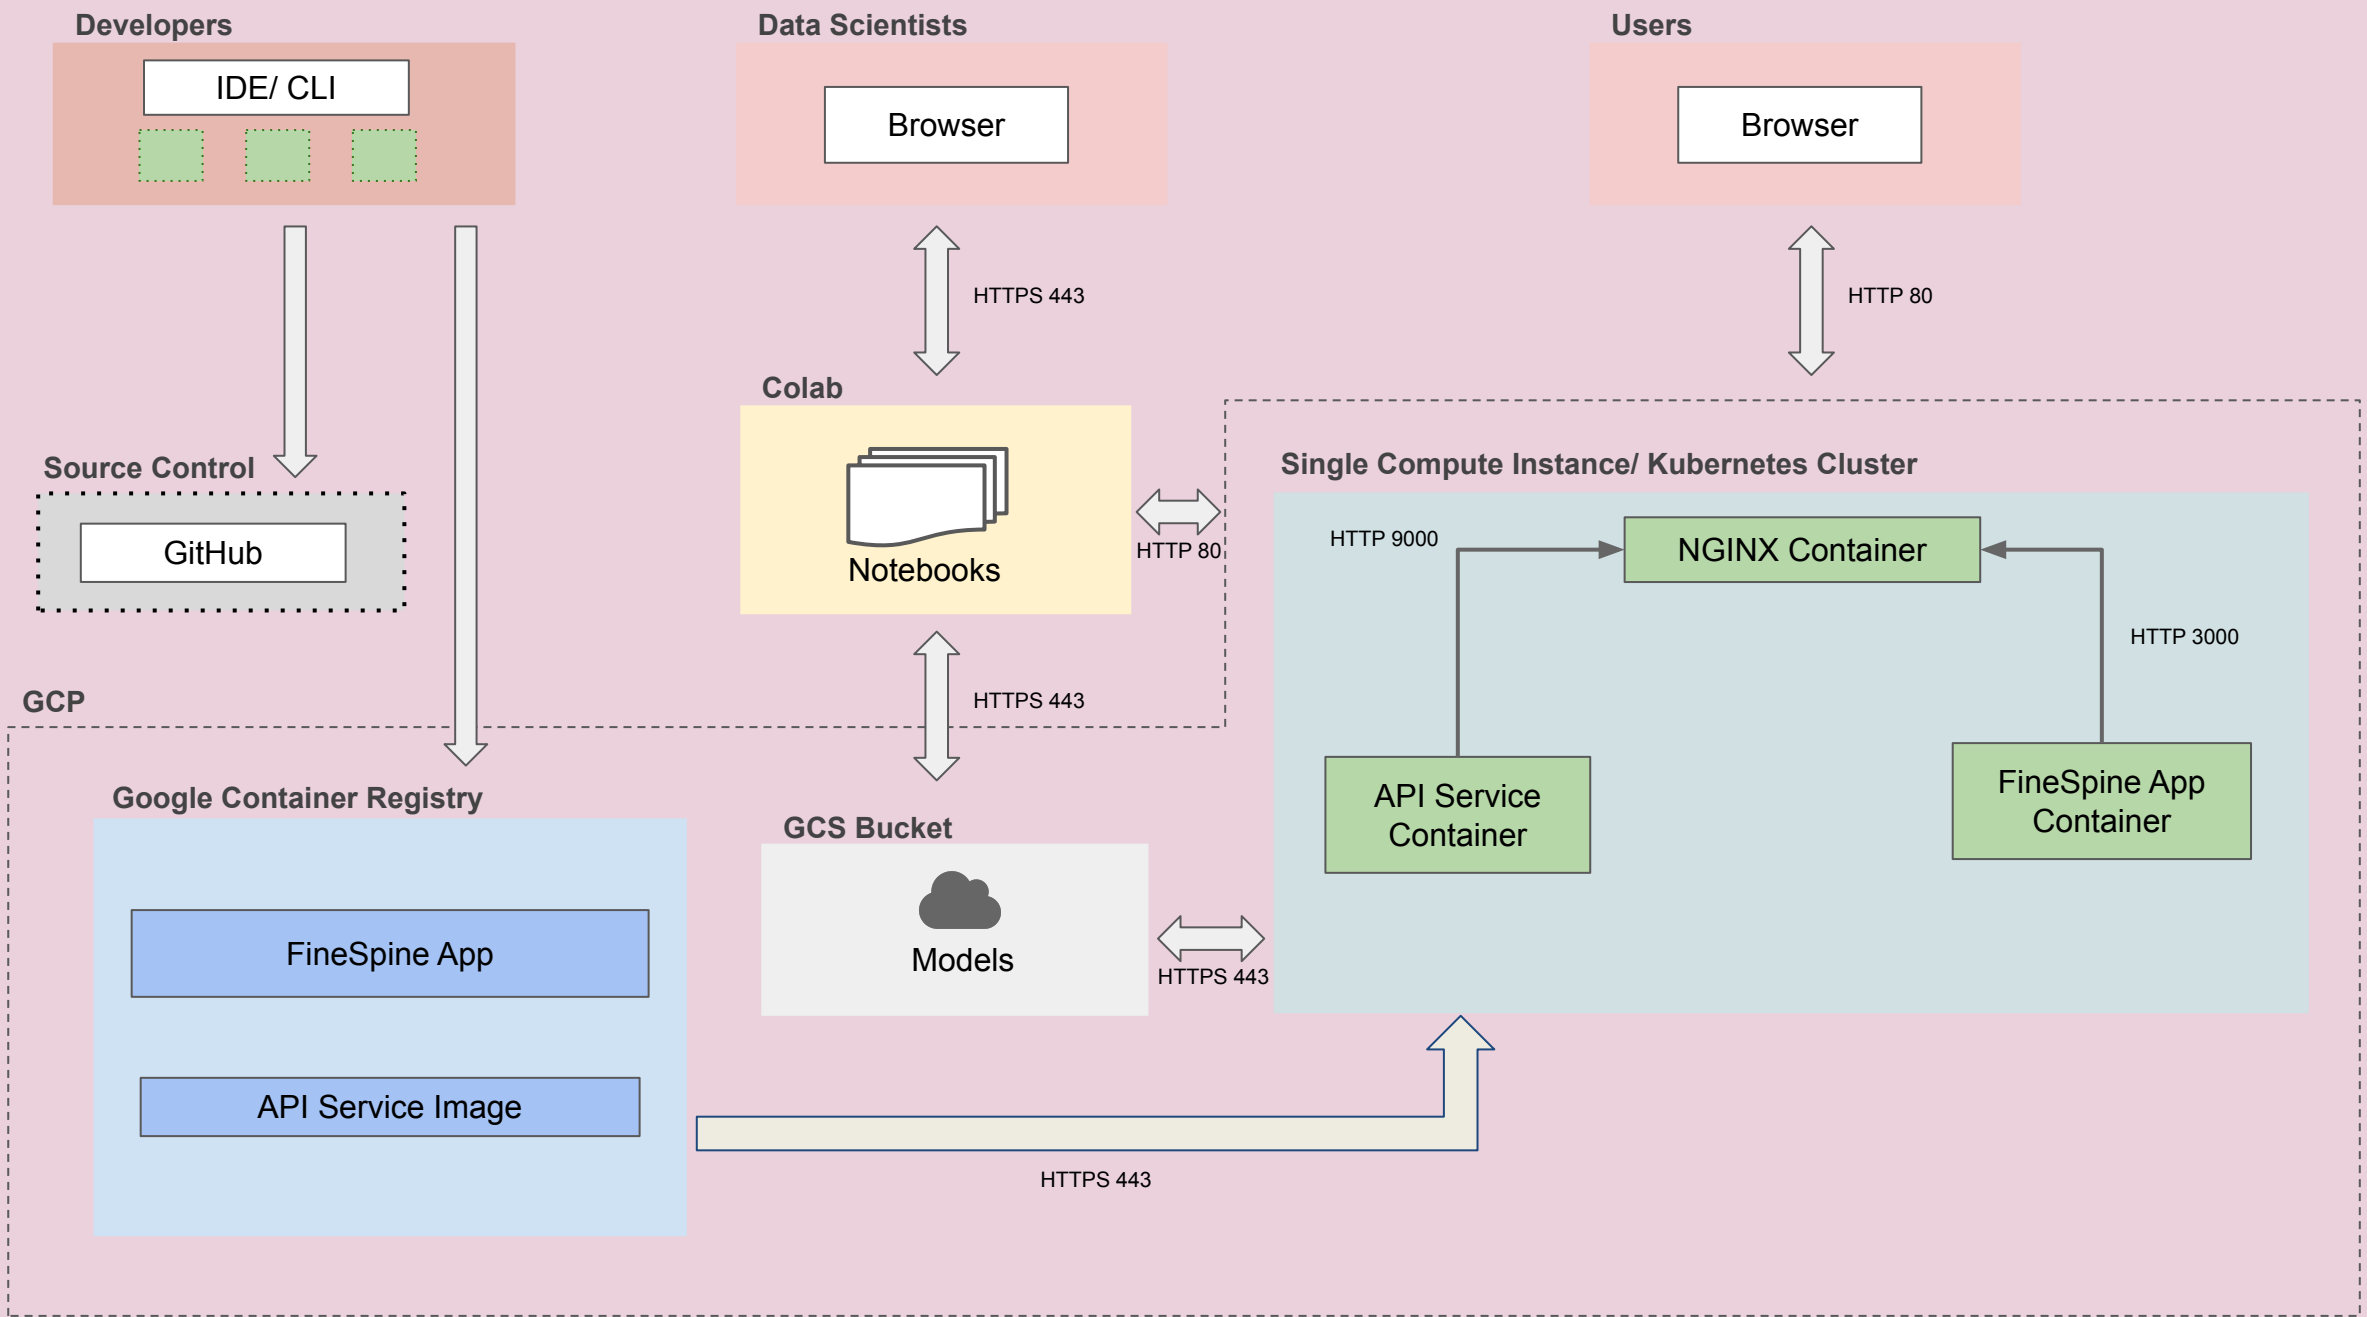

State (Source, Data, Models)

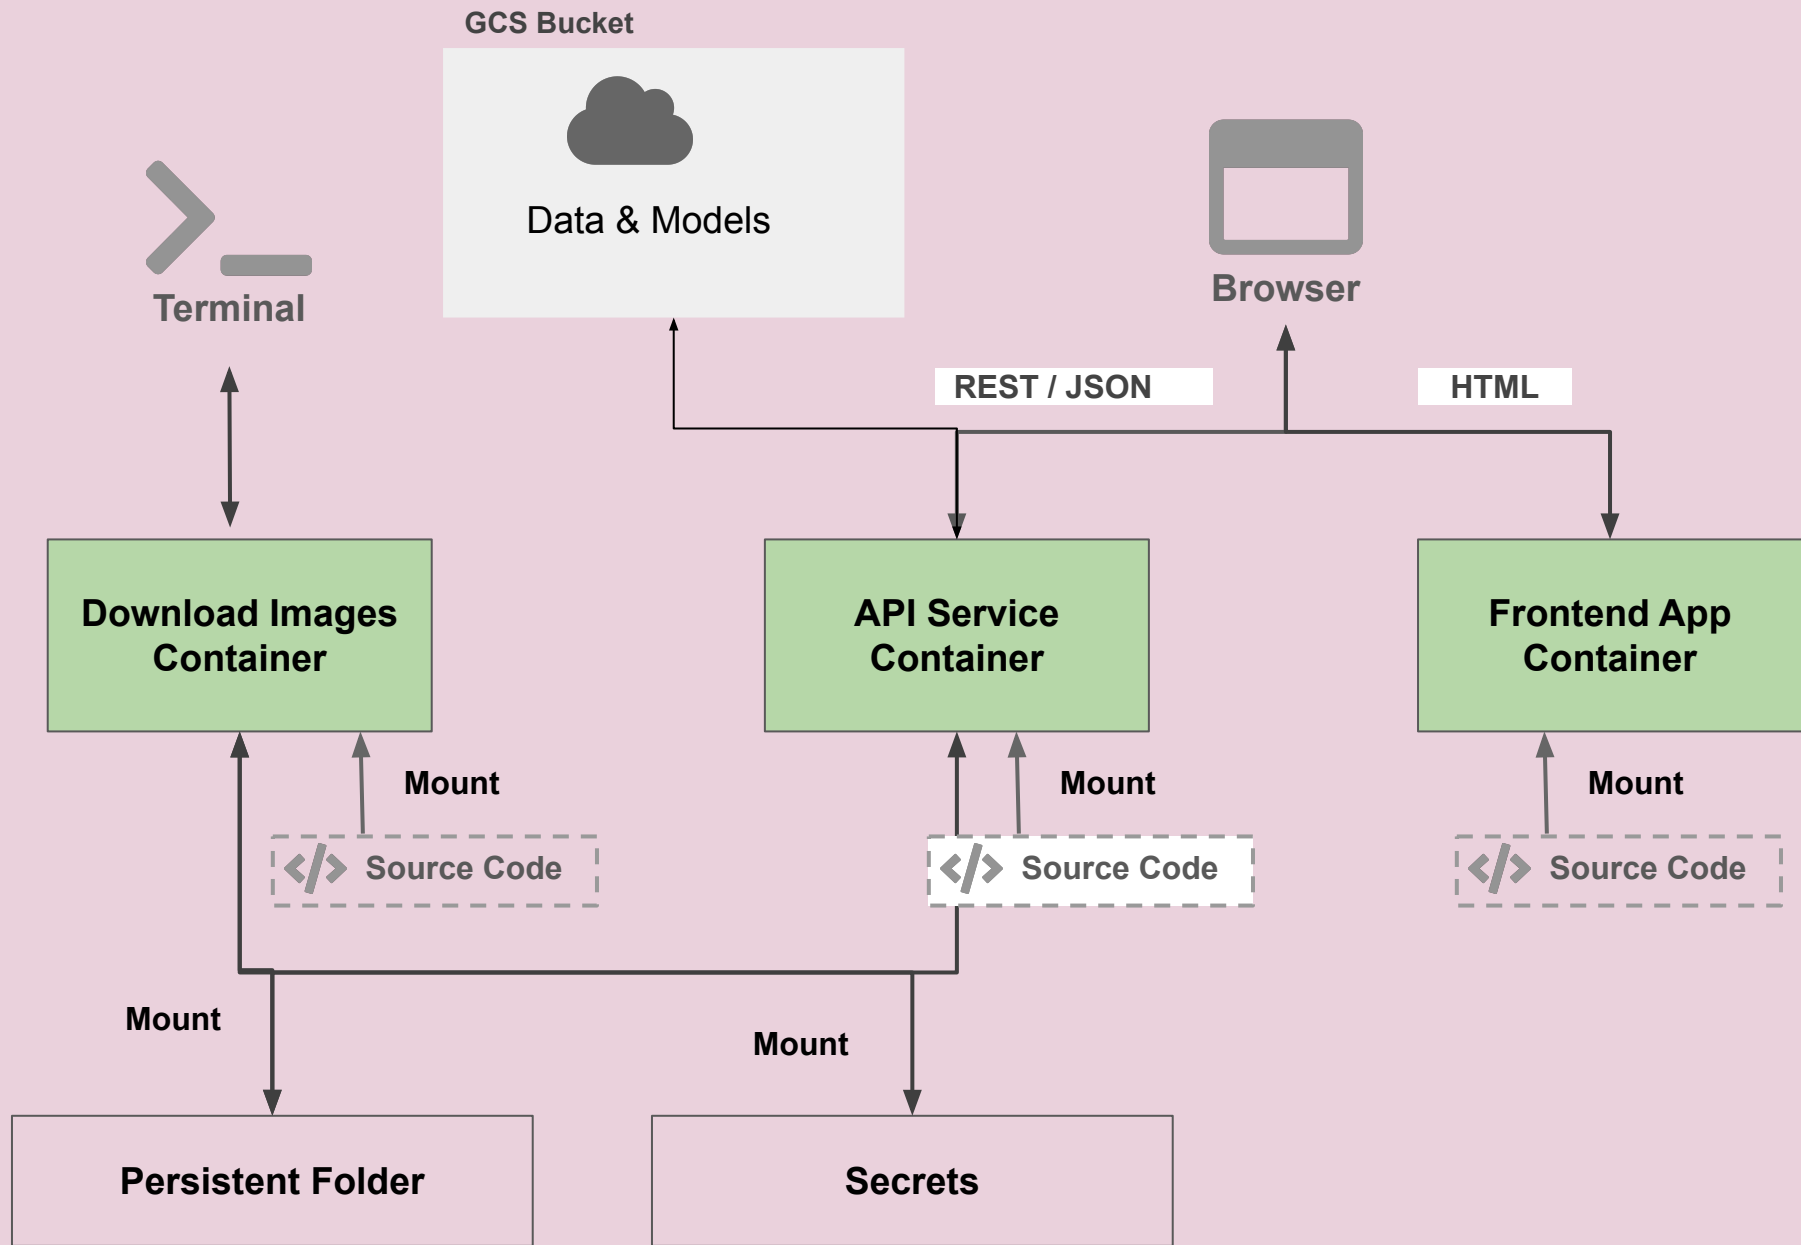

- Save images to GCP bucket
- Save model weights
- Information on preprocessing

Solution Architecture - Group 18 - FineSpine

Technical Architecture

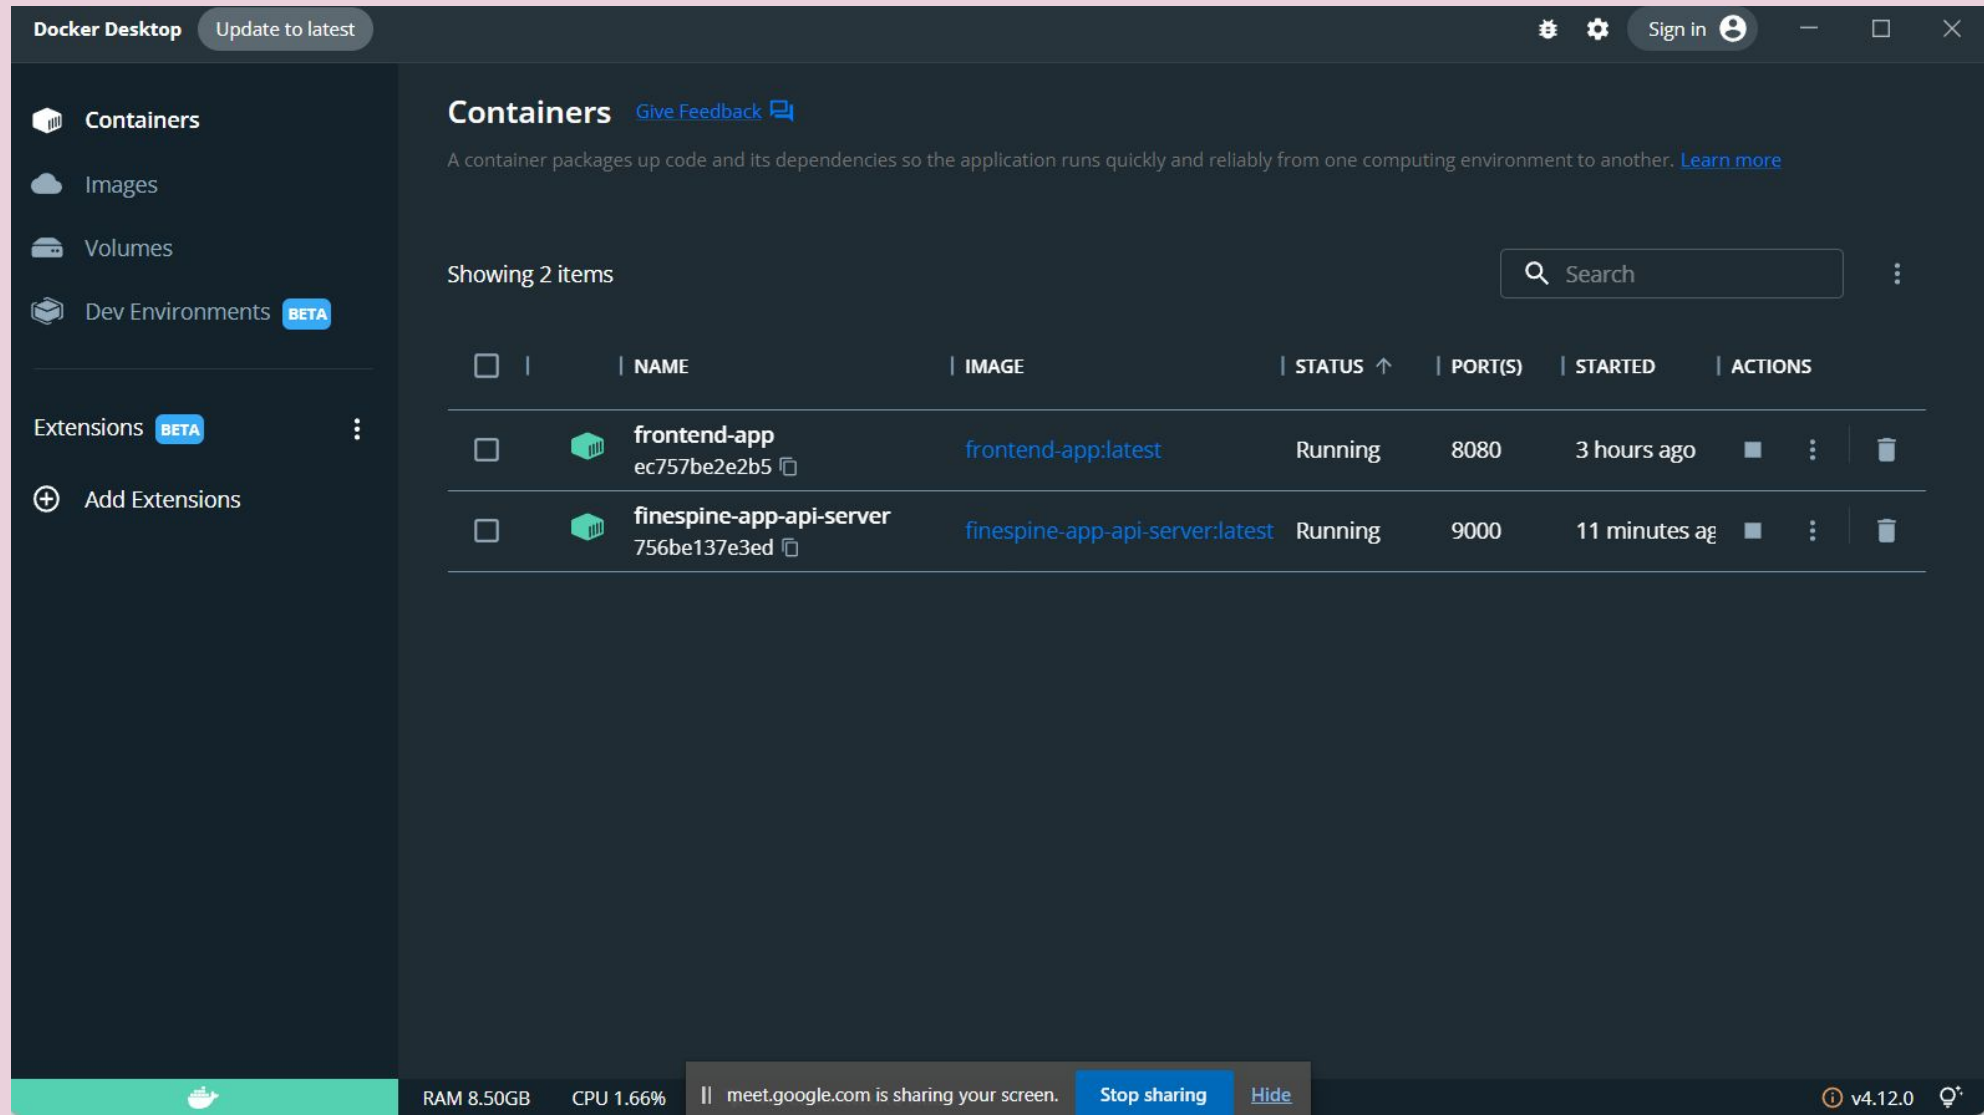

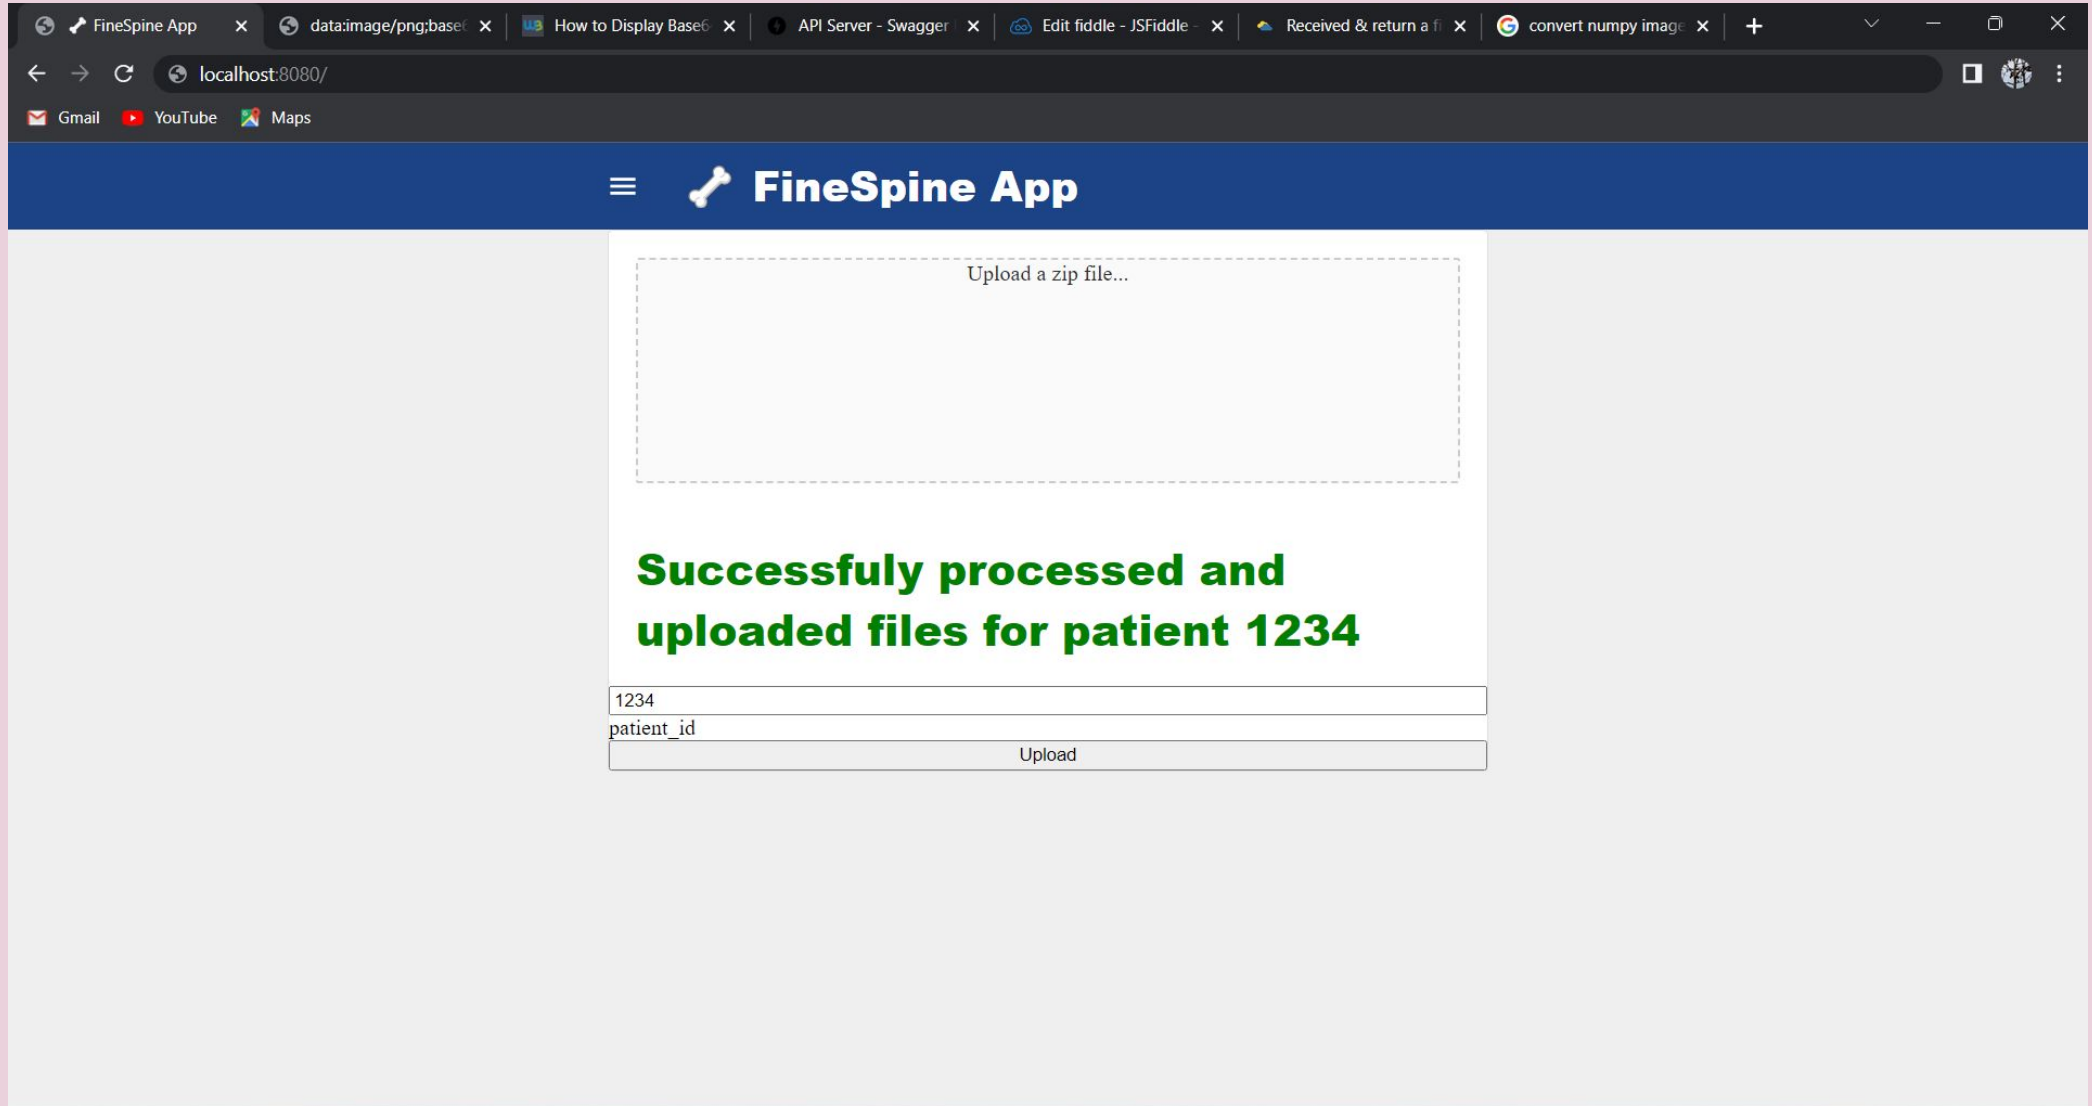

Wireframe Demo (Figma)

- We have created a simple wireframe for our FineSpine app using Figma.
- Go to the link
- Click on the clickable tabs (user/admin login) to navigate through the pages
- Press R to go back to the main page

Production App

- We used React.js for the production.
- Component based framework
- High Performance

Deployment

- Create a standard docker container for deployment

<input type="checkbox"/>		NAME	IMAGE	STATUS ↑
<input type="checkbox"/>		finespine-app-deployment ba59547920bd 	finespine-app-deployment:late!	Running

- Ansible to automate creating and running GCR, GKE

```
- name: "Build docker images and push them to GCR"
  hosts: localhost
  gather_facts: false
  tasks:
    - name: "Get timestamp for docker tag"
      shell: "(date +%Y%m%d%H%M%S)"
      register: tag
    - name: Print tag
      debug:
        var: tag
```

Deployment (GCR and GKE)

- GCR for storing and versioning of the docker containers.

SERVICES

INGRESS

Services are sets of Pods with a network endpoint that can be used for discovery and load balancing. Ingresses are collections of rules for routing external HTTP(S) traffic to Services.
